Is Yawning Contagious? Recall the randomized simulation that we performed in the last of	lass.
Our goal was to assess the claim that being in the seeded group was associated, to a statistic	cally
significant degree, with an increase in the likelihood that a study participant would yawn.	

- 1. What was the $null\ hypothesis$ for your simulation?
- 2. What was the alternative hypothesis for your simulation?
- 3. What was the test statistic?
- 4. Where did the observed test statistic lie in the null distribution?
- 5. Was this data consistent or inconsistent the null hypothesis? That is, do you reject or fail to reject the null hypothesis?
